

# Full Floor Reclaim System

The full floor reclaim system uses multiple reclaim screw assemblies to create a high volume abrasive reclaim system that recycles 100% of the blast media during the blasting operation. Full floor reclaim design requires that the material handling of the work be intricately designed into the configuration of the room. Work piece material handling options include work car/track system, an overhead monorail crane, an overhead bridge crane, or heavy duty floor grating with support steel.
